

THE SMARTEST STORAGE FOR VIRTUAL SERVERS

Compellent's advanced storage virtualization is the perfect complement to any leading virtual server platform, enabling you to amplify the benefits of server virtualization from the data center to the desktop.

Easily Deploy and Manage Virtual Servers

Optimize Storage Performance and Cost

Automated Tiered Storage intelligently places blocks of data on the ideal disk to free up high-performance spindles for the most demanding virtual applications.

Pain Free Provisioning

Automatic LUN masking simplifies storage provisioning for any number of virtual servers. Thin Provisioning eliminates capacity planning and maximizes disk utilization.

Revolutionize Server Management

Easily deploy virtual servers with a six-click boot from SAN wizard. Test patches and roll-out multiple virtual servers in minutes.

Make Changes Without Downtime

Eliminate server downtime for storage management. Dynamically add or change storage attributes without impacting your applications.

Increase Availability, Not Cost or Complexity

Replicate More, Spend Less

Space-efficient Thin Replication and block-level architecture allow you to affordably adopt replication for more virtual servers and leverage low-cost IP lines.

Rapid Set Up and Recovery

Six-click set up requires no advanced training or staff. Predefine recovery volumes, boot remote virtual servers from the SAN or recover any volume to any server within minutes.

Boost Business Continuity and Your Bottom Line

Connect directly to the controller via native iSCSI technology. Replicate without identical configurations at the primary and remote locations. Verify replication without downtime.

Take Green to the Bank-Reduce Energy Costs Up to 93%

Purchase, Power and Cool Only the Storage You Need

Modular architecture scales as you grow, maximizing disk utilization and minimizing energy consumption.

Small Footprint, Big Impact

Advanced virtualization and Thin Provisioning shrink your data center without sacrificing performance by combining the power of all drives into a single pool and consuming physical capacity only when data is written.

Decrease Disk Count, Increase Performance

Automated Tiered Storage reduces the need for high-performance, high-power drives.

Extend the Life of Your Equipment

Increased efficiency maximizes your current resources—reducing upgrades to your power and cooling systems and delaying facility expansions.

"With Compellent at the foundation of our virtual data center, we've been able to drop the number of physical servers we have and the time we spend managing those servers. Along with that, we save on cooling costs by about \$1,000 a month. That's huge."
